a)

Differentiating $y = Ce^{3t} + e^{-t}$ we get:

$$\frac{dy}{dt}y = 3Ce^{3t} - e^{-t}$$

Then, we re-arrange our first equation:

$$Ce^{3t} = y - e^{-t}$$

And substitute it into the second equation:

$$\begin{aligned}y' &= 3(y - e^{-t}) - e^{-t} \\y' &= 3y - 4e^{-t}\end{aligned}$$

Therefore $y = Ce^{3t} + e^{-t}$ is indeed a general analytic solution to the equation $y' = 3y - 4e^{-t}$.
